Sustainability and IT Project Management

The future of business will be established on more sustainable and socially responsible organizations. Sustainable operations will be required in order to match a continuous process of adjustments between economic, environmental and social aspects. In this process, Information Systems (IS) can also be aligned to be an efficient system in context of sustainable business strategy. Examples of project stakeholders include project leader, project team members, upper management, project customer, resource managers, line managers, product user group, and project testers.
